Urbanization impacts

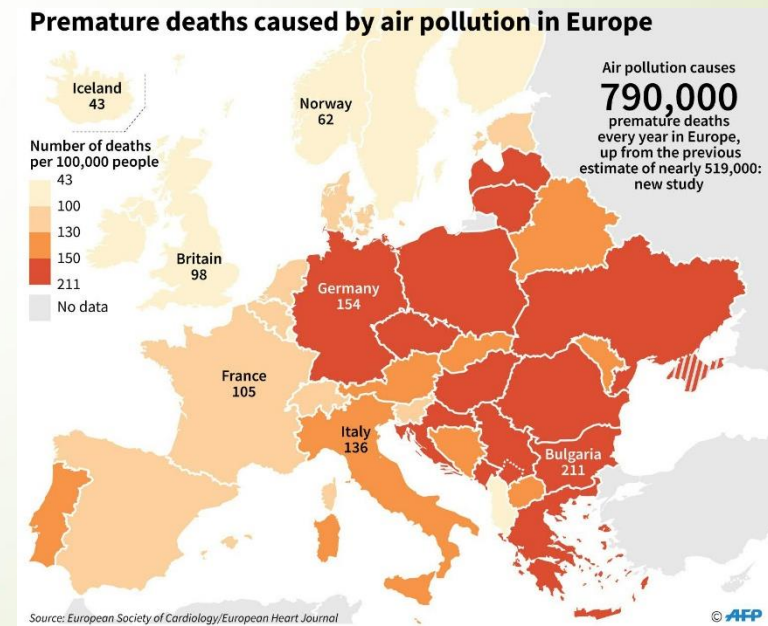

- **Cities** host **more than half** of the **world's population** (75% by 2050) and are responsible for **70%** of **greenhouses gas emissions**
- **Climate change impact** on **environment** and **human health** in urban areas (soil consumption and pollution)

Directorate-General for Research and Innovation Climate Action, Environment, Resource Efficiency and Raw Materials – 2015.

Nature-based solutions

simultaneously provide environmental, social and economic benefits

by bringing more nature and natural features and processes into cities, landscapes and seascapes.

This report presents the main findings of the **Horizon 2020** *Expert Group* on 'Nature-Based Solutions and Re-Naturing Cities'

HORIZON 2020

“Solutions that are inspired and supported by nature, which are cost-effective, simultaneously provide environmental, social and economic benefits and help build resilience.

Such solutions bring more, and more diverse, nature and natural features and processes into cities, landscapes and seascapes, through locally adapted, resource-efficient and systemic interventions”

What is NBS?

NBS IMPLEMENTATION PROCESS

- Multistakeholders
- Co-design; Co-implementation; Co-management
- Multipurpose
- Cost-effective
- Locally-adapted
- Easily upscaled spatially and temporally
- Effectiveness assessment

Urban Forest as the best expression of NBS

*Improve
quality of life*

Reduce
Soil Erosion

Improve
Air Quality

Save
Energy

Reduce
Runoff

Reduce
Noise

Microclimate

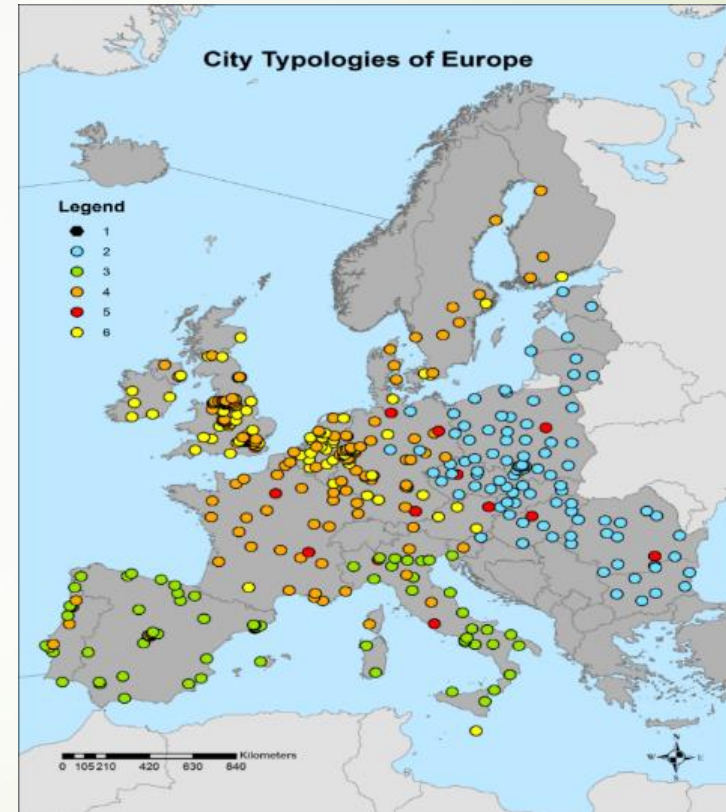

Back in action: NBS projects in Europe

Since **2016**, the EC has funded 17 NBS sister projects (and a new call is now ongoing) to:

- implement NBS in the European cities
- develop participatory models based on the quadrupole helix
- investigate the NBS benefits
- create an open access repository where all the NBS case studies are described and compared
- provide stakeholders and decision-makers with guidelines to implement NBS able to answer to specific, local challenges

IMPACT ASSESSMENT FRAMEWORK

Raymond, C.M., Frantzeskaki, N., Kabisch, N., Berry, P., Breil, M., Razvan Nita, M., Geneletti, D., Calfapietra, C. (2017). A framework for assessing and implementing the co-benefits of nature-based solutions in urban areas. *Environmental Science and Policy*. 77:15-24.

10: Economic Opportunities/Green Jobs

- increase in mean land/property price
- new jobs created, gross economic value added
- food/other goods production
- energy saving
- environmental benefits

Estimated economic benefits provided by street trees in the Green Bay Metro Area (Wisconsin, USA)

NBS Assessment Plan

in ProGIReg

B - SOPARC	Number of users and type of physical activity for a specific NBS	Survey performed by using the "System for Observing Play and Recreation in Communities", in a pre-post design (1 PM per implementation, under the guidance of ISGLOBAL)
C - Economic and labour impact questionnaire	Economic impact indicators of a specific NBS	Survey about economic parameters to be submitted to the organisation in charge of NBS implementation as well as to the organisation in charge of long-term management (1 PM per FRC, under the supervision of SL)
D – Carbon impact	Carbon storage; saved carbon dioxide emissions	Mathematical models applied to a specific NBS, based on either environmental, GIS or economic data. (timing depends on the NBS)
E - Air quality	Ozone (O ₃) and nitrogen dioxide (NO ₂) concentrations	Discontinuous concentration measurements by passive diffusion tubes in the proximity of the NBS and in a control site, repeated before the implementation and two times after. For each monitoring site, 36 passive diffusion tubes are needed (3 tubes x 2 gases x 3 years = 18 passive tube samples for both sample and control sites). Samples should be placed onsite, removed after three weeks, and sent for analysis. FRC will be in charge of installing, removing and sending the sensors (6 working days in three years) and buying sensors for the two post implementation campaigns. CNR will be in charge of purchasing and installing the sensors for the pre implementation campaign
F - Air temperature	Air temperature	Continuous measurement of air temperature inside an NBS and in a control site over three years. For each monitoring site, 6 temperature sensors are needed (3 for the site and 3 for the control site). The sensors should be checked monthly for data download and battery (9 working

Laboratory

Field

Promoting the potential of flux-measuring stations in urban parks: An innovative case study in Naples, Italy

Guidolotti et al. 2017, Agriculture and Forest Meteorology

Wind distribution for the period March 2015 – April 2016 (panel a). Half hourly cumulative fluxes distances representing the peak (white circles) (panel b), 70% (dark grey circles) and 90% (light grey circles) (panel c) for the period March 2015 – April 2016. Cumulative fluxes distances were calculated using the footprint model of Kljun et al. (2004).

Concentrations

and **fluxes**

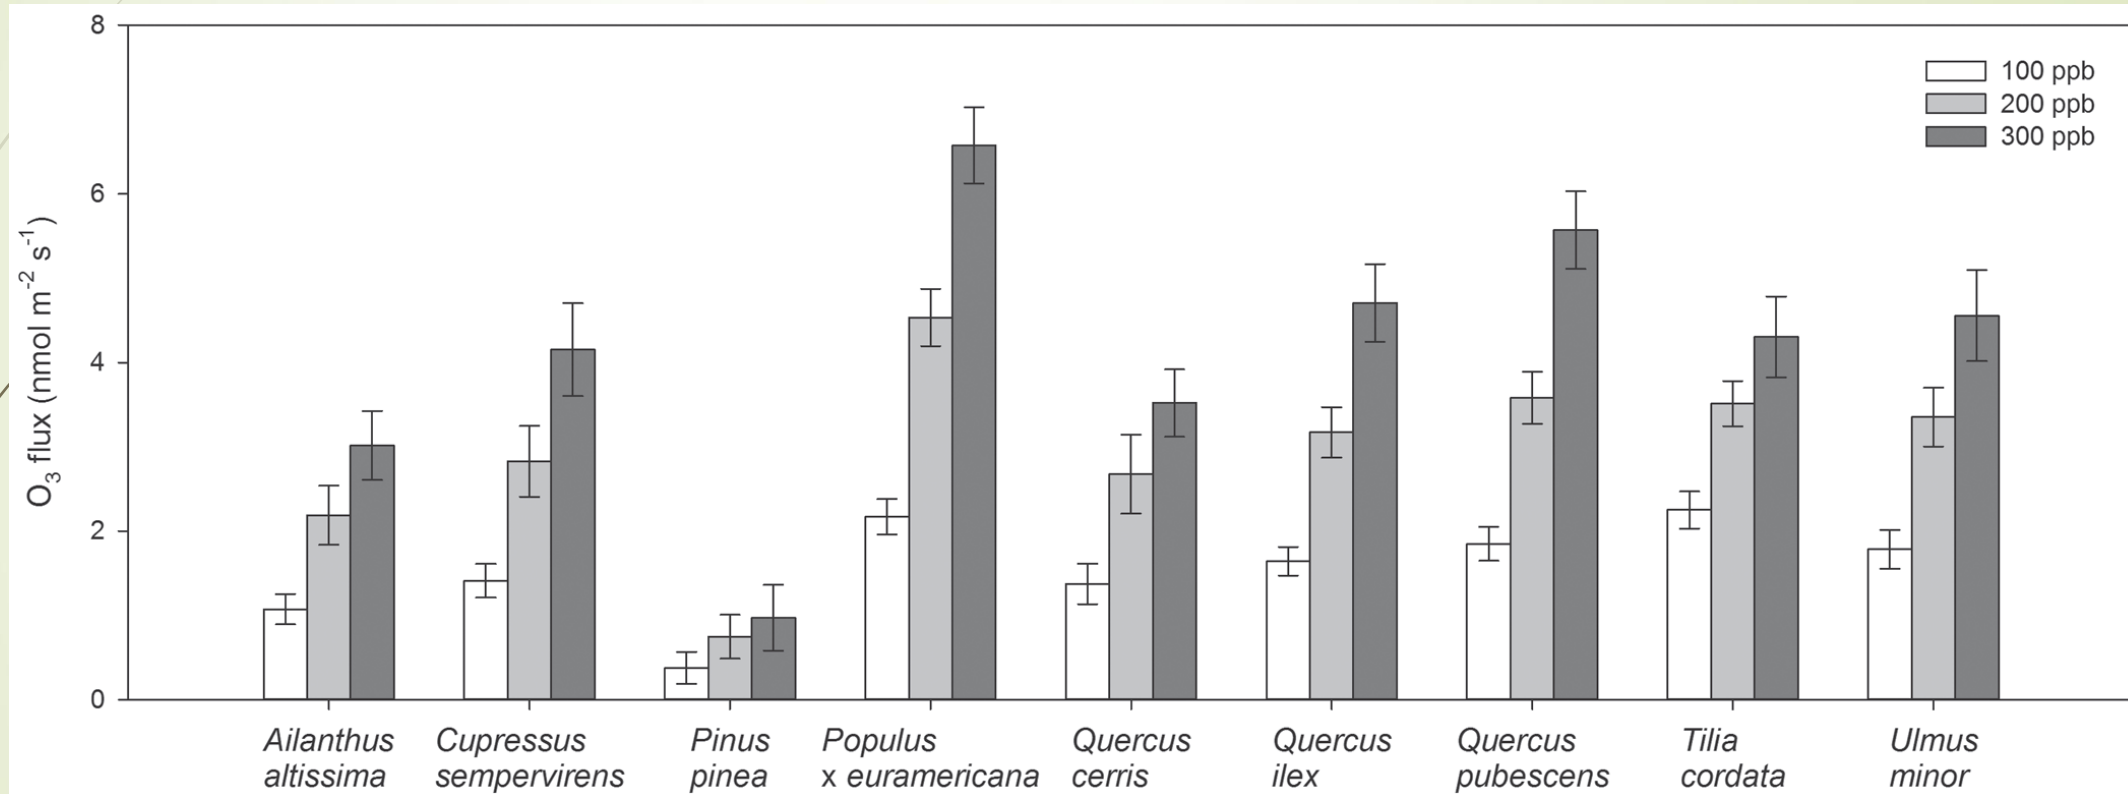

at the end

of March 2015

(Guidolotti et al. 2017)

Laboratory *cuvette* results

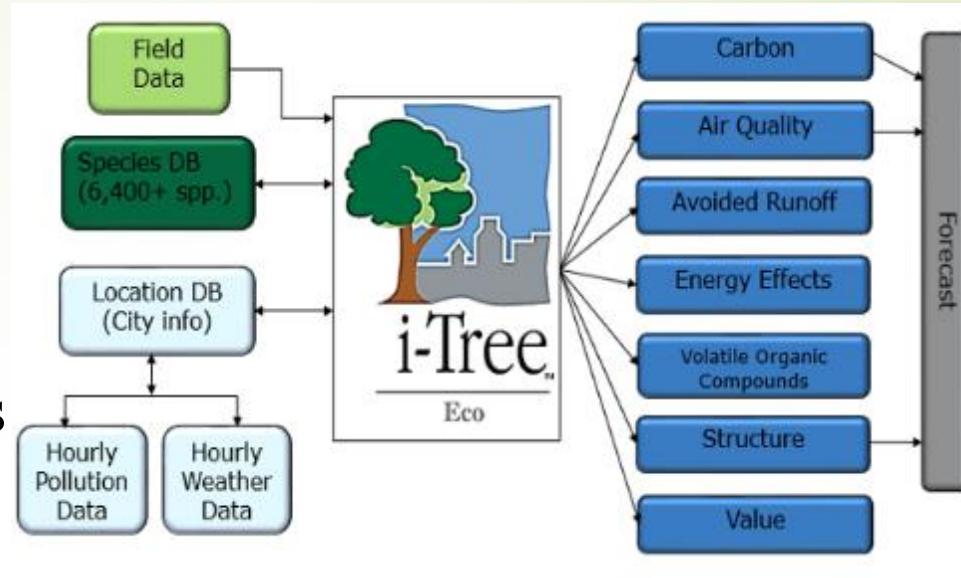

- 
1. To quantify benefits provided by urban trees
 2. To maximize their contribution to the improvement of quality life (species selection, trees management)
 3. To help city managers and policy makers (planning)

**Why do we need to
model ecosystem
services?**

i-Tree Eco model

i-Tree is a model developed by the USDA:

- To quantify urban forest structure
- To estimate urban forest's benefits
- To calculate energy and emission savings

Kim et al. 2015

i-Tree Eco - modules

A: Anatomy of the Urban Forest

- Species composition
- Tree density
- Tree health
- Leaf Area
- Leaf and tree biomass

C: Carbon Storage and Sequestration

- Total stored carbon
- Carbon sequestered annually

B: Biogenic Volatile Organic Compound (BVOC) Emission

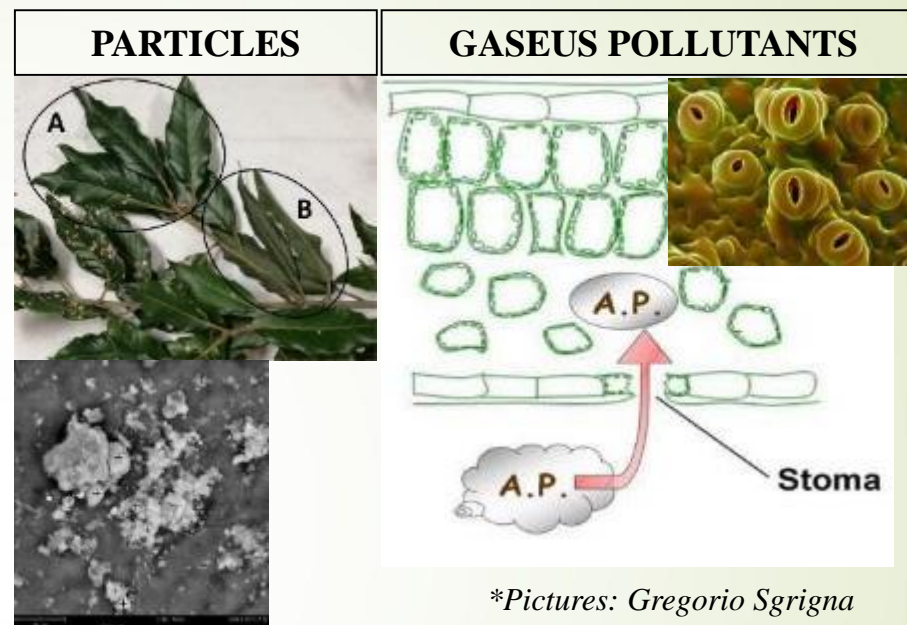

- BVOC emissions (isoprene, monoterpenes)

i-Tree Eco - modules

D: Dry Deposition of Air Pollution

- Pollution removed by trees (O_3 , SO_2 , NO_2 , CO and $PM_{2.5}$)
- Percent improvement in air quality throughout a year

E: Energy Conservation

- Carbon emissions avoided due to the energy savings (trees close to buildings)
- Heat island effect

SPECIFIND: find the best tree species in your city

Report

Estimate Values per Area Unit

Generate Report per Specie Genus

Show ▼

In the report you will get a list of the most used tree species for urban greenery, arranged according to a score (rank) expressing the degree of compliance with chased requirements.

Climatic and site requirements are measured (if you specify the location), the correspondence to the possible required height and the value of the potential environmental benefits of species, weighted according to the specified scale of importance from 0 to 10 (*).

In the report there are reported indicative benefit estimates for single adult plant (or m²), too, if required to display them.

Conclusions

- **Decision-support tools** for planning green space and improving citizens' quality of life
- **Maximizing ecosystem services** of urban green spaces:
 - Species selection
 - Planting priority index
 - Management and monitoring of trees and urban forests
 - Evaluation of costs and externalities
- **Validation** and **integration** of models with **experimental results** (research)
